

OMNIPOS

A smarter daily operating system for your retail business.

Client Product Guide

Sales • Inventory • Customers • Reporting • Multi-branch • Web App

Prepared for client review • July 2026

One system. A clearer shop day.

OmniPOS brings checkout, stock, purchasing, customer balances, expenses and business reporting into one role-controlled application. It is designed for retail teams that need speed at the counter and visibility for managers.

What it helps you achieve

- Reduce manual stock updates by recording stock movements as sales and received purchase-order items are processed.
- Give staff a consistent checkout flow for cash, mobile money and card payments.
- Make daily decisions from sales, cost, expense and low-stock information.
- Operate more than one branch while keeping branch-level stock and activity distinct.

A simple operating flow

Set up your shop, branches, staff, taxes and products → **sell** at the POS (by search, barcode or QR scan) → **replenish** through purchase orders and stock controls → **review** sales, stock and expenses → **act** on alerts and reports.

Built for practical retail

The application supports products and services, barcode/name search, customer selection, taxes, discounts, printable receipts and invoices. It can be run as a native desktop application through its NativePHP-based delivery.

Your day at a glance

The dashboard is the operational starting point: today's sales and expenses, orders, product count, recent activity, top sellers and low-stock items in one place.

Illustrative application view using sample data. Final views reflect your shop configuration and permissions.

Why it matters

Managers can spot opportunities and exceptions without assembling spreadsheets. Low-stock visibility supports timely ordering, while recent sales and top products provide context for staffing and merchandising.

Checkout that keeps the queue moving

The Point of Sale is designed around a searchable product list and a persistent cart. Staff can find items by name, barcode or QR code, filter by category, change quantities and complete a sale from one screen.

At checkout

Use the **Scan** button to open the device camera and scan a barcode or QR code; a matching product is added directly to the cart. USB barcode scanners are also supported as keyboard input, and the scanner screen provides manual barcode entry. Then select a walk-in or saved customer; apply a discount; calculate configured taxes; choose cash, mobile money or card; record a payment reference where relevant; then complete the sale.

After the sale

The system creates the sales record, updates stock for inventory items and can present a receipt for printing. Receipt sharing options include email and WhatsApp where the appropriate customer details and device configuration are available. Managers and above can initiate refunds from recorded sales.

Stock control and purchasing

OmniPOS makes inventory a live business process, not a periodic exercise. Products carry selling price, cost, barcode, category, units, images and low-stock thresholds; services can also be sold without physical stock.

The screenshot displays the 'Inventory & purchasing' section of the OmniPOS interface. The top header includes the OmniPOS logo, the title 'Inventory & purchasing', and an 'Admin' button. Below the header, there are three summary cards: 'Inventory value' (GHS 68,450), 'Low stock' (8 items), and 'Open purchase orders' (3). The main content area is divided into two columns. The left column, titled 'Purchase orders', contains a table with three rows of purchase order data. The right column, titled 'Stock control', contains a list of five actions with circular icons.

Purchase orders			
PO-1028	Brightline Supplies	Pending approval	GHS 4,300
PO-1027	Wholesale Hub	Partially received	GHS 2,160
PO-1026	Fresh Goods Co.	Received	GHS 1,840

- Create products & services
- Import product catalogue
- Set low-stock thresholds
- Adjust and audit stock
- Transfer stock between branches

Illustrative application view using sample data. Final views reflect your shop configuration and permissions.

Replenishment workflow

Create a purchase order, add the required items and quantities, obtain approval where required, then receive all or part of the order. Received quantities increase available stock. Stock can also be adjusted with movement history and transferred between branches.

Faster onboarding

Product import and a downloadable template support initial catalogue loading. This reduces the effort of moving from a paper list or spreadsheet into the system.

Know your customers and credit position

Customer records centralise names, contact details, purchase history and outstanding balances. Counter staff can attach a customer during checkout or create one when needed.

Credit with visibility

For a customer sale, an amount paid can be lower than the total, creating a balance to manage. Repayments can be recorded against that customer, giving staff and managers a clear account position.

Proactive follow-up

The application includes configurable email capability and a scheduled debt-reminder command. Use this with your agreed credit policy and verified recipient contact data.

Measure sales, stock and expenses

Reports turn the day-to-day transaction record into management information. Date filtering helps owners and managers compare performance over the periods that matter to them.

Illustrative application view using sample data. Final views reflect your shop configuration and permissions.

Sales reporting

Sales reporting provides revenue, cost of goods, expenses and calculated profit for the selected period, plus a daily revenue trend, top products and transaction-level detail.

Stock and expense visibility

The stock report presents branch inventory, low/out-of-stock filters and inventory value/profit potential. Expense management supports categories, receipt attachment/download and a dedicated expense report.

Important note

Reports are based on the transactions and costs entered into OmniPOS. Accurate prices, costs, receipts and stock receiving procedures are essential for meaningful results.

Scale with branches, staff and controls

A growing business needs delegation without losing control. OmniPOS has branch-aware stock and sales, branch switching for authorised users, and distinct roles for key responsibilities.

Roles at a glance

Owner / Admin: Manage branches, staff, settings, taxes and core administration. **Manager:** Manage products, reports, restocking and approved operational controls. **Cashier:** Use the POS, customer and permitted expense workflows. The exact screens and actions are restricted by role.

Multi-branch operation

Each branch can maintain its own stock position and branch-specific tax settings. Branch switching lets authorised users work in the correct operational context; stock transfer features help move products between locations.

Operational configuration

Administrators can set business details, currency and receipt content, create tax rates, configure notification preferences, maintain branch email settings and test email delivery. License activation and update history are also provided.

Install as a web app

The login page offers an **Install OmniPOS App** button in compatible browsers. On iPhone or iPad, users can use Safari's *Add to Home Screen*. Installation requires HTTPS in production (or localhost during development), which also enables camera-based scanning.

A practical rollout plan

The best results come from pairing the software with clear working practices. A phased rollout helps your team gain confidence while protecting data quality.

Recommended launch sequence

- 1. Configure:** business profile, currency, branches, taxes and receipt details.
- 2. Prepare data:** product list, costs, prices, opening stock, customer details and staff accounts.
- 3. Train by role:** cashier checkout; manager stock and purchasing; admin reporting and configuration.
- 4. Pilot:** run one counter/branch, validate receipts, camera/USB scanner access and daily close-out, then expand.
- 5. Review:** use weekly sales, stock and expense reviews to refine thresholds and purchasing.

Built-in protection: login attempts are rate-limited (five per minute), and checkout submissions are rate-limited (30 per minute) to help reduce repeated attempts and accidental rapid duplicate requests.

Client checklist

Confirm required branches, staff roles, receipt printer and barcode/QR scanner setup; host the web app on HTTPS; decide payment-reference processes; agree your customer credit policy; and identify who owns daily sales and stock review.

Summary

OmniPOS gives a retail business a single source of operational truth—from the item scanned at the counter to the stock decision and management report that follow.
